

## Accidents

### Advantages

- Allows you to safely record data connected with the investigation of an accident (injured persons, witnesses, damage and other data).
- Guarantees that the final data will be validated by the relevant persons.
- Boosts cooperation among the persons responsible for handling Accidents, through collaborative functionalities.
- Improves completion of pending tasks.

### General Functionalities

- Recording data concerning the accident, affected parties and witnesses.
- Recording information on any damage to property, production or the environment.
- Workflow with stages for handling the accident.
- Nonconformity generated automatically from the Accident.
- Automatic and manual involvement of users with different profiles for accessing and modifying.
- Forum for analyzing how the accident is handled (including investigation of the facts, assessment of causes, and other factors).
- Determination of the risks associated with the accident based on a calculation of probabilities according to consequences.
- Tree classification for determining parameterizable causes.
- Generation of reports that enable statistical analysis of accidents.
- Generation of indicators based on data recorded in the accident folder (severity index, frequency index, days lost, etc.).
